Naples, FL 34119

Ref: Cane Toad Report – March 2025

### **Visits took place this month -**

Friday Night, March 7<sup>th</sup> FULL

Friday Night, March 14<sup>th</sup> HALF

Friday Night, March 28<sup>th</sup> HALF

**Summary of Visit –** A thorough inspection of the HOA's common grounds (streets throughout Palmira) took place for the removal of the invasive Cane toads. There was an estimated count of 170 Cane toads removed throughout this month. The areas reported from Management and/or Owners have been checked well and we will keep on our radar for future visits. We highly recommend that Owners keep lights off at night, or switch to bug lightbulbs. This will help keep the Cane toads from hanging out close to homes, under lights.

The warmer weather is starting to move in, and the first round of breeding has already begun. We have been working with the CDD on tadpole removal visits and have already removed an estimate of over 25 gallons of tadpoles from active lakes. Please continue to report to us right away when tadpoles are seen in any lake.

\*\*Native Southern Toads are present in this community as well, not all are Cane Toads.  
Invoice attached.

### **Upcoming Visits: The below dates are tentatively scheduled for the 2025 year -**

Friday Night, April 4<sup>th</sup> HALF

Friday Night, April 11<sup>th</sup> FULL

Friday Night, April 25<sup>th</sup> HALF

Friday Night, May 2<sup>nd</sup> HALF

### Identifying a Cane Toad

Remove the invasive species

One of the easiest ways to tell the Cane toad and Native toad apart is by looking on top of their head. The Southern toad, native to Florida, has a crest on top of their head. Think of the crest as a crown, and they should be treated as royalty. The toads with the crown can be left alone. The invasive Cane toad has a smooth head. They do not have the crest like the Southern toads.

Above Pictures: The top picture is a Southern toad, showing the crest on top of the head. The bottom picture is a Cane toad, showing the smooth head, no crest.
